

KKKhane — Operational Flow

Changes & Testing Guide • Restaurant Management System

Generated 30 Jun 2026 • main @ f8ad26e

This document summarises the operational-flow work delivered in this round and gives a concrete, step-by-step way to test each flow. The build implements the "REVISED VERSION" spec — every task is owned by a specific staff member (single-owner "I am going / I am cooking" model), partial completion is supported, and customers, kitchen, waiters, delivery staff and managers each get a tailored view.

Where things live: Customer = scan a table QR (`/t/<table>`) or the takeaway/delivery QR (`/takeout/<restaurant>`). Staff = Kitchen, Waiter, Cashier panels. Manager = Admin → Settings. Most behaviours are gated by a *feature flag* in **Settings** → **Feature Flags** (tier-defaulted, manager-toggable).

1. Shipped features at a glance

#	Feature	Who uses it	Flag / setting
#11	Kitchen: per-dish Cook / Queue / Pass with chef ownership	Kitchen	—
#12	Table lifecycle (Occupied → Dirty → Clean) + cleaning ownership	Waiter	—
#13	Mode 2 — waiter confirms/rejects orders before the kitchen	Waiter, Customer	Waiter Order Confirmation
#14	Online delivery ordering (address + verification code)	Customer	Takeout/Delivery
#15	Delivery staff panel (claim → verify code → delivered)	Waiter	Takeout/Delivery
#16	Manager quick-serve items + serve ownership	Manager, Customer, Waiter	Quick-Serve Items

Foundational changes earlier in the same effort: optional waiter-managed sessions / self-service ordering (#7), unified stock & recipe management (#8/#9), and per-item order status (#10).

2. Kitchen — per-dish Cook / Queue / Pass #11

The kitchen board is **dish-centric**: an order splits across sections by each dish's own state, so one dish can be cooking while its siblings wait. Sections: **New Orders** (just placed, < 2 min) · **Queue** (waiting ≥ 2 min, oldest first) · **Cooking** (in progress, tagged with the chef) · **Pass** (ready).

- **Cook** a dish → only that dish moves to Cooking and is *claimed* by that chef.
- A dish not cooked within **2 minutes** auto-moves to Queue (no action needed).
- **Only the chef who started a dish can Mark Ready** it; others see it locked with the owner's name.
- Marking a dish Ready sends it to Pass and notifies the waiter (naming the dish).

How to test

1. As a customer, place a dine-in order with **2+ different dishes**.
2. Open **Kitchen**. In New Orders, select one dish and click **Cook** → only that dish moves to **Cooking**; the others stay in New Orders.
3. Leave a dish untouched ~2 minutes → it slides into the **Queue** column (oldest at top).
4. Open a **second Kitchen tab as a different chef**. Confirm you cannot **Mark Ready** a dish the first chef started (button hidden/locked, shows owner).
5. Mark a cooking dish **Ready** → it appears in **Pass**, and the Waiter panel shows a "Ready to Serve" alert naming that dish.

3. Waiter — table lifecycle + cleaning ownership #12

Closes the dine-in loop: **Occupied** → (pay) **Dirty** → (clean) **Available**. Occupancy is derived from the active session; paying/closing a table marks it **Dirty** and alerts the floor.

- A dirty table can be claimed with "**I am going**"; only that waiter can then **Mark Clean**.
- Others see who is cleaning it (view-only).

How to test

1. Open a table (session active) → it shows **Occupied** in the Waiter floor plan.
2. Collect cash / close the session → the table flips to **Dirty**; a "Table X needs cleaning" toast appears for waiters.
3. Tap the dirty table → **I am going**. In a second waiter tab, confirm **Mark Clean** is not available (shows "... is cleaning").
4. Back in the first tab, **Mark Clean** → the table returns to **Available**.

4. Mode 2 — waiter order confirmation #13

Optional, plan-gated. When **Settings** → **Waiter Order Confirmation** is ON, a placed dine-in order waits for a waiter to confirm the customer is really seated before the kitchen sees it. Premium tiers keep direct-to-kitchen (Mode 1). Stock is deducted on *confirm*, so rejects cost nothing.

How to test

1. In **Settings** → **Feature Flags**, enable **Waiter Order Confirmation**.
2. Place a dine-in order. Confirm it does **not** appear in the Kitchen yet.
3. Open **Waiter** → **Orders to Confirm**. **Confirm** → it appears in the Kitchen (with a chime) and stock is deducted.
4. Place another order and **Reject** it (pick a reason). The customer's order page shows "Order Cancelled — <reason>".
5. Turn the flag OFF → new orders go straight to the kitchen (Mode 1), as before.

5. Online delivery – ordering & staff panel #14 #15

Customers can place **delivery** orders with an address; the system issues a **4-digit verification code**. The kitchen cooks them through the takeout pipeline; a waiter then delivers and confirms with the code.

How to test (end-to-end)

1. Open the takeaway/delivery page `/takeout/<restaurant>`, add items → checkout.
2. Toggle **Delivery**, enter Name, Phone and **Delivery Address** → place the order.
3. The order page shows a large **Delivery Code** (e.g. 5827) – note it.
4. **Kitchen**: the order appears in the takeout/delivery queue → cook it → **Ready**.
5. **Waiter** → **Deliveries**: the ready order appears (with a chime). Click **I'm going** to claim it (a second waiter then can't take it).
6. The card shows the address + tap-to-call phone. Click **Mark Delivered** → enter the customer's code → **Delivered**. A wrong code is rejected.

Reuses the waiter role (no separate delivery login). Delivery completion does not change payment status (COD vs prepaid is an open decision).

6. Manager quick-serve items + serve ownership #16

Managers configure one-tap "quick serve" items; customers request them; a single waiter owns each request.

How to test

1. **Settings** → **Quick-Serve Items**: add e.g. **Cold Drink** (and remove any you don't want).
2. On the customer table page, open the floating service panel → **Cold Drink** appears as a one-tap request. Tap it.
3. **Waiter** → **Service Requests**: tap **On it** in one tab. In a second waiter tab, confirm only the claimer can mark it **Done** (others see "... is on it").

If a manager hasn't configured any items, the panel falls back to sensible defaults (Need Water, Need Silverware).

7. The ownership rule (applies everywhere)

Whenever someone takes a task – **I am cooking** (chef), **I am going** (cleaning / serving / delivery / cash) – **only that person can complete it**. This is enforced on the server (atomic claim), not just hidden in the UI, so two staff can never double-handle the same task. It now covers: cooking a dish, cleaning a table, serving a quick-item request, confirming an order, and delivering an order.

8. Notes for testers

- Most staff actions are **real-time** – open two browser tabs (as different staff) to see ownership and live updates.
- Feature flags are per-restaurant and tier-defaulted; toggle them in **Admin** → **Settings** → **Feature Flags**.
- Each feature shipped as its own reviewed PR with a green preview build; database changes were applied additively (existing data keeps working).
